Fuller Wheat

Fuller is a new hard red winter wheat variety selected from a population with an unknown pedigree. 'Fuller' was released by the Kansas State University Agricultural Experiment Station in July 2006.

Wheat Facts:

- > Wheat works well in crop rotation
- > Wheat is inexpensive to produce
- > Historically, wheat is consistently profitable
- > Wheat in Texas enjoys a price advantage over other producing regions due to Gulf-coast export markets, and metropolitan milling markets
- > Wheat production spreads labor and equipment demands through the production year
- > Wheat is well adapted to Texas

DOUGLASS KING SEED CO.

Fuller Hard Red Wheat

Fuller is a bronze-chaffed, semi-dwarf hard winter wheat, most closely resembling Jagger. It is medium in height with average straw strength and excellent yield potential. Fuller is early maturing, heading a day later than Jagger with test weight patterns superior to Jagger. Fuller has fair to good winter-hardiness and a medium long coleoptiles. It is also more tolerant to shattering than Jagger.

Fuller has been highly resistant to leaf rust and stripe rust throughout its testing. It is resistant to soil-borne mosaic virus and spindle streak mosaic virus. It is also moderately resistant to stem rust, speckled leaf blotch, and tan spot and moderately tolerant to wheat streak mosaic virus. Fuller is moderately susceptible to powdery mildew and low pH soils and is susceptible to Fusarium head blight (Scab), greenbug, Russian wheat aphid, and Hessian fly.

Its speckled leaf blotch and tan spot resistance make it suitable for continuous wheat production. The improved tolerance to shattering also makes it a viable option as an early maturing hard red winter wheat for western Kansas. Due to its average straw strength, Fuller is not recommended for irrigated production. It is not suited to low soil pH conditions.

(Allan K. Fritz, T. Joe Martin, and James P. Shroyer, *Fuller Hard Red Wheat*, Kansas State University, May 2007)
